

# oneSAFE™

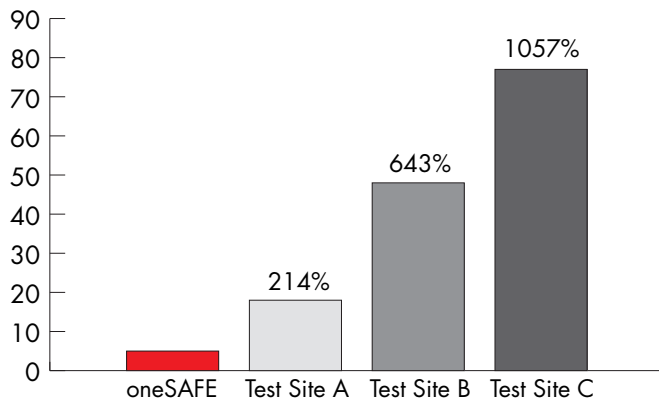

SINGLE-GLOVE DISPENSING SYSTEM

## oneSAFE™ is 8-10 Times Cleaner & More Hygienic

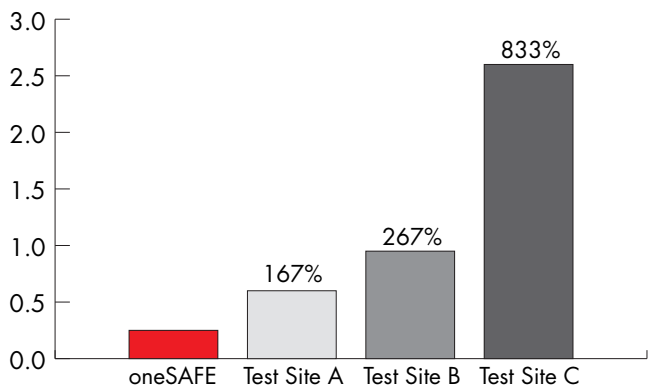

### Surface Contamination: oneSAFE™ vs. Traditional Glove Boxes

New test data shows significant increase in both colony forming units (CFUs) and spore-forming bacteria (SFB) on the surface area around the opening on traditional glove boxes compared to similar area on the oneSAFE™ boxes. Due to the unavoidable touches by multiple users around the opening on traditional glove boxes, the risk of cross-contamination significantly increases. oneSAFE's single glove dispensing system and cuff first design, greatly reduces contamination around the opening area of the box and decreases the risk of cross-contamination.

Colony Forming Units per glove box

Spore Forming Bacteria (SFB) per glove box
